"Direct sequencing of the activation peptide and the catalytic domain of the factor IX gene in six species.";
Genomics 6:133-143(1990)
-!- FUNCTION: PACTOR IX IS A VITAMIN K-DEPENDENT PLASMA PROTEIN THAT PARTICIPATES IN THE INTRINSIC PATHWAY OF BLOOD COAGULATION BY CONVERTING FACTOR X TO ITS ACTIVE FORM IN THE PRESENCE OF CA++ IONS, PHOSPHOLIPIDS, AND FACTOR VIIIA.
-!- CATALYTIC ACTIVITY: Hydrolyzes one Arg-|-11e bond in factor X to
                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-AUG-1990 (Rel. 15, Created)

-!- SUBUNIT: FACTOR IX IS ACTIVATED BY FACTOR XIA, WHICH EXCISES TACTIVATION PEPTIDE AND THUS PRODUCES A MOLECULE CONSISTING OF CHAINS. HELD TOGETHER BY ONE OR MORE DISULIDE BONDS.
-!- SIMILARITY: BELONGS TO PEPTIDASE PAMILY SI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ovis aries (Sheep).

Biol. Chem. 265:1858-1861(1990).
-!- FUNCTION: FACTOR IX IS A VITAMIN K-DEPENDENT PLASMA PROTEIN THAT PRATICEDATES IN THE INTRINSIC PATHWAY OF BLOOD COAGULATION BY CONVERTING FACTOR X TO ITS ACTIVE FORM IN THE PRESENCE OF CA++ IONS, PHOSPHOLIPIDS, AND FACTOR VIIIA.
-!- ÇATALYTIC ACTIVITY: Hydrolyzes one Arg-|-1le bond in factor X to
                                                                                                                                                                                                                                                                                                                                                                                         form factor Xa.

-!- SUBUNIT: FACTOR IX IS ACTIVATED BY FACTOR XIA, WHICH EXCISES THE ACTIVATION PEPTIDE AND THUS PRODUCES A MOLECULE CONSISTING OF 2 CHAINS HELD TOGETHER BY ONE OR MORE DISULFIDE BONDS.
-!- MISCELLANBOUS: CALCIUM BINDS TO THE GAMMA-CARBOXYGLUTAMIC ACID (GLA) RESIDUES AND, WITH STRONGER AFFINITY, TO ANOTHER SITE, BEYOND THE GLA DOMAIN.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.

Natl. Acad. Sci. U.S.A. 86:10095-10099(1989).

-!- FUNCTION: FACTOR IX IS A VITAMIN K-DEPENDENT PLASMA PROTEIN THAT PRAFICATES IN THE INTRINSIC PARHWAY OF BLOOD COAGULATION BY CONVERTING FACTOR X TO ITS ACTIVE FORM IN THE PRESENCE OF CA++ IONS, PHOSPHOLIPIDS, AND FACTOR VIIIA.

-!- CATALYTIC ACTIVITY: Hydrolyzes one Arg-|-1le bond in factor X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       REMINES, PRO07291 9147 1.

"Direct sequencing of the activation peptide and the catalytic domain of the factor IX gene in six species.";
Genomics 6:133-143(1990).
-!- FUNCTION: FACTOR IX IS A VITAMIN K-DEPENDENT PLASMA PROTEIN THAT PARTICIPATES IN THE INTRINSIC PATHWAY OF BLOOD COAGULATION BY CONVERTING FACTOR X TO ITS ACTIVE FORM IN THE PRESENCE OF CA++
IONS, PHOSPHOLIPIDS, AND FACTOR VIIIA.
-!- CATTALYTIC ACTIVITY: Hydrolyzes one Arg-|-11e bond in factor X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SERINE PROTEASE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Griffin, John H.

APPLICANT: Mesters, Rolf M.

TITLE OF INVENTION: Anti-Peptide Antibodies, Systems and Therapeutic Methods

TITLE OF INVENTION: Anti-Peptide Antibodies, Costems and Therapeutic Methods

TITLE OF INVENTION: For Inhibiting Coagulation

NUMBER OF SEQUENCES: 10

Application US/08766288

Patent No. 596940

GENERAL INFORMATION:
TITLE OF INVENTION: Factor IX - Polymeric Conjugates
INTERPORTER OF SEQUENCES:
CORRESPONDENCES:
ADDRESSE: GALGANO & BURKE
STATE: New York
COUNTY: Hauppauge
CITY: Hauppauge
STATE: New York
COUNTY: USA
ZIP: 11748
COMPUTER READABLE FORM:
MEDIUM TYPE: Diskette, 3.50 inch, 1.44 Mb Storage
COMPUTER: MR Compatible
COMPUTER: Word Compatible
COMPUTER: Word Compatible
SOFTWARE: WordPerfect 6.1
CURRENT ApplicATION NUMBER: US/08/766,288
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ANTI-SENSE:

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Mesters, Rolf
TITLE OF INVENTION: Serine Protease-Derived Polypeptides and
TITLE OF INVENTION: Anti-Peptide Antibodies, Systems and Therapeutic Methods
TITLE OF INVENTION: for Inhibiting Coagulation
NUMBER OF SEQUENCES:
ADDRESSEE: Office of Patent Counsel, The Scripps
ADDRESSEE: Research Institute
STREET: 10666 North Torrey Pines Road, TPC 8
CITY: La Jolla
STATE: CA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression in an age-related manner and/or in a liver-specific manner. The invention identifies regions of the human factor IX (hPIX) gene, and a region of the human protein C (hPC) gene, which are age-related regulatory sequences. The hFIX age-related regulatory sequences are designated AES' (AAFS4015) and AES' (AAFS4017) and are found in the 5' UTR (at position 2164-2165 of AAFS4018) and 3' UTR (at position 314383-35655 of AAFS4018) respectively. These elements act synergistically
                                                                                                           The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon Nucleic-acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid sequences which regulate gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     regulatory elements that control age-related gene expression, ful in gene therapy and for reducing Factor IX expression

to increase hFIX levels over the lifespan of an individual; however, they can independently exert effects on hFIX mRNA in an age-related manner, with AES' acting to stabilise hFIX mRNA, and AES' acting to stabilise hFIX mRNA, and AES' acting to increase hFIX mRNA levels, over time. AES' also directs liver-specific expression. The hFC gene age-related regulatory sequence is found in the S' UTR (AAF54081), and contains two PEA-3 (polyoma virus activator 3) elements of the invention, along with their homologues, variants and fragments, may compare in the construction of recombinant expression vectors for the expression of a desired sequence in an age-related fashion in a host coll. Preferred target genes for expression in such age-regulatable expression vectors include those encoding proteins involved in blood coagulation (e.g., the pro-coagulants factor IX and factor VIII, and the anti-coagulants protein c and anti-infrombin III), human alto anti-coagulants protein c and anti-thrombin III), human alto anti-coagulants protein cand anti-thrombin III), human alto anti-coagulants protein conditions such as confirmed and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the T3 promoter, cardiovascular disease, disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detect, isolate or identify other such sequences in samples. The present sequence represents a fragment of hFIX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        normal processes such as ageing and gene expression. Fragments and homologues of age-related regulatory sequences, are useful as probes to
